A bounded estimator

Abstract

The latent state is not observed. Error decreases only if noise is independent.
This synthetic page has a full-width abstract above two body columns.

1. Method

Read this left column first.
The latent state remains fixed
unless an intervention changes it.
A 12.5% improvement occurred
at 20 ms, but not at 10 ms [1].

$$e(z) \leq 0.05$$

The bound is sufficient,
not necessary. Continue at the
top of the right column.

2. Results

This is the second body column.
Prediction does not imply causation.

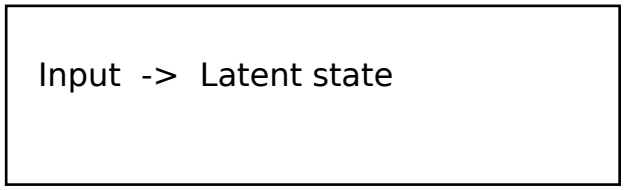

Figure 1. Prediction, not causation.

Table 1. Conditional error.

Setting	Error
Independent noise	0.04
Dependent noise	0.12

[1] Timing excludes initialization.

Appendix A. Limits

This image-only page uses a single column.

The latent state may change under an intervention.

The bound may fail under dependent noise.

The threshold is 0.05, not 0.5.

Read symbols against the pixels, not an empty text extraction.

[2] No observations were removed.
